G. Drainage Assessment

G.1 Introduction

This section summarizes the hydrotechnical drainage assessments for the:

- trunk storm sewer systems as identified by the City in the City GIS data;
- watercourse culverts; and,
- roadway and driveway culverts.

All existing trunk storm sewers were likely initially designed as a part of the minor drainage system. For the future/upgrades scenarios, the trunk storm sewer network was organized into two groups: the major and minor drainage systems. Consistent with the City of Courtenay Subdivision and Development Servicing Bylaw No. 2919 – 2018, driveway culverts were considered part of the minor drainage system. Roadway and watercourse culverts were considered part of the major drainage system. The trunk storm sewers and culverts were assessed for existing and future land use and climate conditions as discussed below.

G.2 Trunk Storm Sewer Assessment

Results from modelling the City trunk storm sewer network highlighted a number of areas where existing pipes are undersized and surcharging above the pipe inlet crowns and above road/ground surface elevations. The culverts assessment is presented in Section G.3.

Trunk Storm Sewer Assessment Criteria

Criteria to manage stormwater within the City was referenced from the City of Courtenay Subdivision and Development Servicing Bylaw No. 2919 – 2018, as shown below in Table G-1.

Table G-1: Summary of Existing Stormwater Criteria

Application	Criteria/Methodology
Conveyance	
Minor Drainage System	Consists of pipes, gutters, catch basins, driveway culverts, open channels, watercourses, and stormwater management “best management practices” (BMPs) designed to capture, convey, treat, or modify flows up to and including the 1 in 10-year return period storm event.
Major Drainage System	Consists of surface flow paths, roadways culverts, watercourses, and stormwater management facilities designed to capture, convey, treat or modify larger flows up to and including the 1 in 100-year return period storm event. If required to accommodate low building elevations, and if approved, a piped minor system may be enlarged or supplemented to accommodate major flows.
Stormwater Management – Rate Control	
Detention Release Rates	All stormwater detention facilities shall be designed to limit post-development peak flows to equal to the corresponding pre-development peak flows for the 2-, 5-, 10-, and 25-year return period storm events. Overland escape routes must be provided to account for

Appendix G – Drainage Assessment

Application	Criteria/Methodology
	<p>greater storms up to 100-year return period in a manner which does not result in flooding of any properties.</p> <p>The total volume of runoff generated during storms can also have a significant impact on receiving watercourses. To the extent possible, the total runoff generated from storms should be minimized through the application of site adaptive planning and the use of source controls. Site adaptive planning focuses on limiting total imperviousness at development sites and preserving natural features such as wetlands, forests, and native soils. Source controls focus on reducing volume by retaining or enhancing opportunities for infiltration and evapotranspiration on development sites.</p> <p>Discharge shall be controlled such that the downstream watercourses receiving outflow from detention facilities are protected from surcharge and erosion. Where stability cannot be maintained, measures to avoid or mitigate erosion shall be proposed.</p>

Minor Drainage System

The minor drainage system was assessed to determine its ability to convey the minor peak flows, generated by the 10-year return period design storm. The following three assessment criteria were used to determine whether each minor system trunk sewer and driveway culvert is undersized:

1. modelled instantaneous peak flow is larger than pipe capacity under free-flowing conditions;
2. pipe surcharged above inlet crown for longer than 15 minutes; and
3. water surcharged higher than 0.3 m above the pipe inlet crown.

All of the above assessment criteria must be exceeded for a pipe/culvert to be considered undersized. The surcharge allowed in the above criteria was incorporated to avoid flagging pipes/culverts that are likely adequate for the design flow with only minor surcharging. It also eliminates minor model instabilities as a reason for flagging a pipe/culvert as undersized.

Major Drainage System

The major drainage system is the conveyance system that carries large storms, greater than the 10-year event and up to the 100-year event. Rights-of-way and road surfaces, roadway and major watercourse culverts, watercourses, surface flow paths, and storm sewers without a safe overland flow route (as discussed below) make up most of the major drainage system in the City.

The interactions between topography, the road network, and the pipe network were reviewed to flag locations that may not have a suitable emergency overland flow route (i.e., sag in the road, dead-end/cul-de-sac, etc.). In locations that had existing trunk storm sewers without a safe overland flow route, those sections of trunk storm sewers were designated and sized as part of the **future (to be upgraded) major 100-year drainage system** for the future conditions. The trunk storm sewers identified as requiring upgrade to future major (100-year) drainage system pipes are shown on Figure 11 in the main body of the report.

Appendix G – Drainage Assessment

Additionally, the following criteria were used to determine whether each segment of existing trunk storm sewer was designated and sized as part of the future (to be upgraded) major 100-year drainage system:

- modelled future land use and future climate scenario 100-year event instantaneous peak flow is larger than the existing pipe capacity under free-flowing conditions; and,
- Surcharging above pipe inlet crown greater than 15 minutes.

Modelling Scenarios and Trunk Storm Sewer Assessment Results

Consistent with the previous IRMP Phase 1 and 2 modelling and assessment scenarios, and as requested by the City, the below land use and climate conditions modelling scenarios were simulated to assess the conveyance capacity for the City trunk storm sewers.

1) Existing Land Use and Existing Climate Scenario

The existing land use models were built to include the existing City-wide storm sewer and culvert network including several detention ponds/facilities according to the information in their respective as-built drawings. Figure 4 in the main body of the report shows the 2-year capacity assessment. Figure 5 in the main body of the report shows the 10-year capacity assessment and the trunk sewers that exceeded the minor system (10-year) assessment criteria described above, under the existing land use and climate conditions. Table G-2 lists the existing trunk storm sewers that exceeded the assessment criteria for the 10-year event. In total, 269 minor system trunk sewers of the 477 total minor system trunk storm sewers are identified as undersized. The capacity assessment results sheets are also included in this appendix.

Table G-2: Existing Minor Trunk Sewers Undersized for Existing Land Use and Climate

Appendix G – Drainage Assessment

2) Future Land Use with Future (Year 2050) Climate Change Scenario

To simulate future land use conditions, the City's Official Community Plan (OCP) future land use GIS data was used. The OCP future land use is shown on Figure 7 in the main body of the report.

Minor Drainage System

Figure 9 in the main body of the report shows the minor drainage system (10-year) trunk sewers that exceeded the assessment criteria, under the future land use and future climate (Year 2050) conditions. These undersized trunk sewers are listed in Table G-3. The capacity assessment results sheets are also included in this appendix.

In total, 204 minor system trunk sewers of the 477 total system trunk storm sewers are identified as undersized.

Major Drainage System (Future Upgrades)

Undersized trunk storm sewers requiring upgrade to future major drainage system (100-year) pipes, due to lack of a safe overland flow route, are shown on Figure 11 in the main body of the report and listed in Table G-4. The capacity assessment results sheets are also included in this appendix.

In total, 103 existing trunk storm sewers are identified as requiring upgrade to future major drainage system (100-year) pipes.

Table G-3: Minor Trunk Storm Sewers Undersized for Future Land Use and Future Climate

G.3 Culverts Assessment

Culverts Assessment Criteria

Criteria to manage stormwater for culverts was referenced from the City of Courtenay Subdivision and Development Servicing Bylaw No. 2919 – 2018, as shown in Table G-1 above in Section G.2.

Appendix G – Drainage Assessment

Consistent with the criteria in Table D-1, the assessment criteria used to identify undersized culverts is as follows:

- **Major Drainage System Culverts**
 - Roadway and watercourse culverts – 100-year design storm peak flow is required to be conveyed without significant surcharging above the culvert inlet crown.
- **Minor Drainage System Culverts**
 - Driveway culverts - 10-year design storm peak flow is required to be conveyed without significant surcharging above the culvert inlet crown.

Modelling Scenarios and Culvert Assessment Results

Consistent with the previous IRMP Phase 1 and 2 modelling and assessment scenarios, and as requested by the City, the below land use and climate conditions modelling scenarios were simulated to assess the conveyance capacity for culverts within the City.

1) Existing Land Use and Existing Climate Scenario

Driveway culverts were assessed for the minor drainage system 10-year design storm conveyance capacity under existing land use and existing climate conditions. Undersized driveway (minor system) culverts were identified at multiple locations and are shown on Figure 5 in the main body of the report. In summary, 2 driveway (minor system) culverts of the 13 total modelled driveway culverts are identified as undersized.

City roadway and major watercourse culverts were assessed for the major drainage system 100-year design storm conveyance capacity. Undersized roadway and major watercourse (major system) culverts were identified at multiple locations and are shown on Figure 6 in the main body of the report. In summary, 31 roadway and major watercourse (major system) culverts of the 57 total modelled roadway and major watercourse culverts are identified as undersized. The capacity assessment results sheets are also included in this appendix.

2) Future Land Use with Future Climate Change Scenario

Driveway culverts were assessed for the minor drainage system 10-year design storm conveyance capacity under future land use and future climate change (Year 2050) conditions. Undersized driveway (minor system) culverts were identified at multiple locations and are shown on Figure 9 in the main body of the report. In summary, 2 driveway (minor system) culverts of the 13 total modelled driveway culverts are identified as undersized. City roadway and major watercourse culverts were assessed for the major drainage system future 100-year design storm conveyance capacity. Undersized roadway and major watercourse (major system) culverts were identified at multiple locations and are shown on Figure 10 in the main body of the report. In summary, 33 roadway and major watercourse (major system) culverts of the 57 total modelled roadway and major watercourse culverts are identified as undersized. The capacity assessment results sheets are also included in this appendix.

The legend on Figures 5, 6, 9, and 10 shows the Pipe Performance Ranking and Ground/Road Flooding Ranking. Culverts with red pipe performance ranking exceeded the assessment criteria. Culverts with red ground/road flooding ranking not only surcharged above the inlet crown, but also flooded above the ground level as indicated in the SWMM model.

2-Year Existing Scenario Capacity Assessment Results

City of Courtenay - IRMP (Phase 3)

Storm System Performance Assessment:

Existing 2-Year Design Storm (without 15% Climate Change increase) - Existing Land Use Conditions

Pipe Performance Ranking

- Green = No Capacity Issues
- Yellow = Between 80% - 100% Capacity and pipe crown surcharging < 30cm
- Orange = Greater than 100% Capacity but no significant pipe crown surcharging
- Red = > 100% Capacity and pipe crown surcharging > 30cm and > 15 minutes
- Dashed Red = Surcharging of pipe crown > 30cm and > 15 minutes that may be due to backwater

Ground/Road Flooding Ranking

Storm Trunk Sewers:

- Green = Ground/Road Flooding = 0 minutes
- Red = Ground/Road Flooding > 0 minutes possible

Culverts:

- Green = No Ground/Road Flooding occurring
- Red = Ground/Road Flooding occurring

Storm System Performance Assessment:

Existing 2-Year Design Storm (without 15% Climate Change increase) - Existing Land Use Conditions

Pipe Performance Ranking

- Green = No Capacity Issues
- Yellow = Between 80% - 100% Capacity and pipe crown surcharging < 30cm
- Orange = Greater than 100% Capacity but no significant pipe crown surcharging
- Red = > 100% Capacity and pipe crown surcharging > 30cm and > 15 minutes
- Dashed Red = Surcharging of pipe crown > 30cm and > 15 minutes that may be due to backwater

Ground/Road Flooding Ranking

Storm Trunk Sewers:

- Green = Ground/Road Flooding = 0 minutes
- Red = Ground/Road Flooding > 0 minutes possible

Culverts:

- Green = No Ground/Road Flooding occurring
- Red = Ground/Road Flooding occurring

Storm System Performance Assessment:

Pipe Performance Ranking

- Green = No Capacity Issues
- Yellow = Between 80% - 100% Capacity and pipe crown surcharging < 30cm
- Orange = Greater than 100% Capacity but no significant pipe crown surcharging
- Red = > 100% Capacity and pipe crown surcharging > 30cm and > 15 minutes
- Dashed Red = Surcharging of pipe crown > 30cm and > 15 minutes that may be due to backwater

Ground/Road Flooding Ranking

Storm Trunk Sewers:

- Green = Ground/Road Flooding = 0 minutes
- Red = Ground/Road Flooding > 0 minutes possible

Culverts:

- Green = No Ground/Road Flooding occurring
- Red = Ground/Road Flooding occurring

Pipe Performance Ranking

- Green = No Capacity Issues
- Yellow = Between 80% - 100% Capacity and pipe crown surcharging < 30cm
- Orange = Greater than 100% Capacity but no significant pipe crown surcharging
- Red = > 100% Capacity and pipe crown surcharging > 30cm and > 15 minutes
- Dashed Red = Surcharging of pipe crown > 30cm and > 15 minutes that may be due to backwater

Ground/Road Flooding Ranking

Storm Trunk Sewers:

- Green = Ground/Road Flooding = 0 minutes
- Red = Ground/Road Flooding > 0 minutes possible

Culverts:

- Green = No Ground/Road Flooding occurring
- Red = Ground/Road Flooding occurring

Storm System Assessment:

Future 2-Year Design Storm (with 15% Climate Change increase) - Future Land Use - Existing Sewers/Culverts

Pipe Performance Ranking

- Green = No Capacity Issues
- Yellow = Between 80% - 100% Capacity and pipe crown surcharging < 30cm
- Orange = Greater than 100% Capacity but no significant pipe crown surcharging
- Red = > 100% Capacity and pipe crown surcharging > 30cm and > 15 minutes
- Dashed Red = Surcharging of pipe crown > 30cm and > 15 minutes that may be due to backwater

Ground/Road Flooding Ranking

Storm Trunk Sewers:

- Green = Ground/Road Flooding = 0 minutes
- Red = Ground/Road Flooding > 0 minutes possible

Culverts:

- Green = No Ground/Road Flooding occurring
- Red = Ground/Road Flooding occurring

Storm System Assessment:

Future 10-Year Design Storm (with 15% Climate Change increase) - Future Land Use - Existing Sewers/Culverts

Pipe Performance Ranking

- Green = No Capacity Issues
- Yellow = Between 80% - 100% Capacity and pipe crown surcharging < 30cm
- Orange = Greater than 100% Capacity but no significant pipe crown surcharging
- Red = > 100% Capacity and pipe crown surcharging > 30cm and > 15 minutes
- Dashed Red = Surcharging of pipe crown > 30cm and > 15 minutes that may be due to backwater

Ground/Road Flooding Ranking**Storm Trunk Sewers:**

- Green = Ground/Road Flooding = 0 minutes
- Red = Ground/Road Flooding > 0 minutes possible

Culverts:

- Green = No Ground/Road Flooding occurring
- Red = Ground/Road Flooding occurring

Storm System Assessment:
